THE BUG MAN

By龃IISA Y. WARD

The presumptive proof had broken the heart of Miss Brantome, newly assigned to the post of bug inspector in the city of Providence. The position had been a source of pride and satisfaction, but the knowledge that her efforts were in vain was too much for her.

She had tirelessly worked to eliminate the bug problem in the city. She had inspected every corner, every nook, and cranny, leaving no stone unturned. Her perseverance and dedication were well known to all.

But the bugs had not been eradicated. Despite her best efforts, they persisted, spreading their numbers and causing chaos. The city was in a state of panic, and Miss Brantome was at the center of it all.

The mayor had called a meeting of the city council, and Miss Brantome had been invited to attend. She was nervous, but determined to present her case.

"I've lived for many years and may have learned a thing or two," she said, addressing the council. "And I know one thing—nothing will be done unless we act quickly."

"We'll see about that," said the mayor, "but you can be assured that we'll do everything in our power to help you."

Miss Brantome left the meeting feeling hopeful. She knew that this was just the beginning of her fight against the bugs. She would not give up until they were driven out of Providence.

The task was daunting, but she was determined to succeed. She knew that with perseverance and a strong will, she could overcome any obstacle.

"I'll give you my word, Mr. Mayor," she said, "I'll do everything in my power to save this city."

"That's all we ask, Miss Brantome," replied the mayor. "And we'll do everything we can to support you."

The meeting ended with a handshake, and Miss Brantome left the city hall, determined to fight for Providence's future. She knew that the battle against the bugs was only just beginning, but she was ready to face whatever challenges lay ahead.

"I'm ready," she thought as she walked down the street. "I'll give it my all, and I know that Providence will be saved."

The disease is caused by the growth of a fungus, known as the "dry rot" or "pith rot," which grows in every part of the potato plant, especially in the leaf and tuber, and by feeding upon the nutritive materials in the potato's stem and tuber tissues.

The fungus appears in the potato tubers after the middle of summer as a fine, white, powdery mold, which slowly turns black as the disease progresses. The disease is most likely to occur where the temperature is high and the humidity is low, as these conditions favor the growth of the fungus.

The fungus spreads to the plant leaves and eventually to the plant stem, causing the leaves to become yellow and eventually fall off. The disease may also spread to the potato tubers, causing them to become soft and rot.

The disease is most likely to occur in potatoes that have been stored at temperatures below 50°F for more than 10 days. The disease is also more likely to occur in potatoes that have been subjected to excessive moisture, such as those that are stored in poorly ventilated areas.

To prevent the disease, it is important to store potatoes at temperatures below 50°F and to maintain good ventilation in the storage area. It is also important to avoid storing potatoes in humid areas, as this can promote the growth of the fungus.

If the disease is detected, it is important to remove the infected potatoes and to destroy the soil in which they were grown. It is also important to avoid planting infected potatoes in the same field for at least two years.

In addition, it is important to avoid planting potatoes in fields that have been previously infected with the disease, as this can increase the risk of infection.

Bottom Prices. The first installment of the Collegeville Baker is disposed of in a few days, and the remaining stock is now in the hands of the Baker. The Baker is disposed of in a few days, and the remaining stock of the Baker is now in the hands of the Baker.
